

TENET

AI actions you can take back — **before they leave.**

One rule, enforced before execution: **no approval, no action.** Every tool-call carries an order that expires, and a receipt that proves it.

[live node · walk it yourself](#) `hackyeah-2026-ai-control-layer-production.up.railway.app/onboarding`

Agents got hands. **Authorization did not change.**

- **The tools shipped first.** Tool-calling agents moved into production systems, and every one of them arrives holding a credential — a password, not an order. MCP gives transport and a consent **framework**; its own spec tells implementers to build the authorization flows themselves.
- **The regulator is already here.** DORA has been in force since 17 January 2025 and covers **22,000+** financial entities and ICT providers in the EU — all of them must now **prove** digital operational resilience, not describe it.
- **So the question stopped being technical.** It is now: under whose authority did that action happen, and can you show it on demand? Nothing on the shelf answers with a stop, not a log.

03:47. The export is already out.

An AI agent calls **crm.bulk_export** with **{email, pesel}**. It holds a password, not an order. Nobody is awake to stop it.

- The log proves **what** happened. It cannot prove **who authorized it**.
- The first signal arrives at 09:15 — the data left hours earlier.
- The regulator asks one question: **under whose authority?**

You cannot trust what you cannot stop.

No approval, no action. **TENET** holds that one rule.

Every tool-call passes the kernel **before it executes**: scope, TTL, signer. One click takes the authority back — and the agent stops mid-flight, not after the export.

AUTHORITY

Identity is bound to one agent and one grant. A grant for one order never authorizes another.

GRANT

HMAC-SHA256 over the scope. The signature is verified **at the gate**, before any rule is read.

REVOKE

One call halts the agent mid-flight. The next call returns REVOKED, not “unknown”.

RECEIPT

Append-only, hash-chained proof: who authorized, under which order, how long it lived.

— Every call is either **rejected before execution** or carries a **receipt**.

A control layer with **a door** — and it opens only for you.

- 1 you **say** what the agent should do — typed or spoken
- 2 **your AI proposes** one concrete action and says what it will touch
- 3 the **kernel decides**: allowed, not allowed, or waiting for you
- 4 you **decide** — and only your decision moves it; nothing runs on its own
- 5 the action is **witnessed** crossing the line (or **stopped** at it)
- 6 you get the **receipt** — a real record from a real round
- 7 **WIN**: the agent acted **inside the line you drew**

Embedding it is one hop: `POST /mcp` in front of the existing tool server — no rewrite of the agent, no rewrite of the tools.

One node in front of one tool server. Sold by the action it authorizes.

WHAT	HOW	STATUS
unit sold	one node = one tool server	built – measured
metering	per authorized action + receipt	built – measured
time to embed	1 endpoint · ~2 weeks	estimate from the architecture
price / ARPA	hypothesis, not an invoice	not claimed – no paid customer
who signs	infosec lead / DPO under DORA	hypothesis

- **Why the meter fits the pain:** the thing the firm must prove is exactly the thing we count — an authorized action and its receipt.
- **Land and expand:** the first node is the pilot; every further tool server is the same hop.

22,000+ entities must **prove** resilience. We sell the proof of one action.

LAYER	NUMBER	WHERE IT COMES FROM
in scope of DORA (EU)	22,000+ entities & ICT providers	published count, 2026
the slice we can reach	firms whose agents already touch customer data	not claimed – no survey run
unit of sale	1 node = 1 tool server	built
arithmetic	nodes × price per node	conditional – price untested

- **Bottom-up, not “1% of the market”:** count the servers that hold the data and the firms that must answer for them.
- **Our honest position:** the size of the market is a published fact; our share of it is a plan, and we label it as one.

The status quo is not a rival we mock. It is three good tools that cannot stop anything.

WHAT FIRMS USE TODAY	WHAT IT DOES WELL	WHAT IT CANNOT DO
logs / SIEM	proves what happened	never authorizes, never stops – evidence after the fact
IAM / PAM	binds identity to systems	an agent borrowing a human’s identity carries no intent
human-in-the-loop chat	a human double-checks	approval without expiry or revoke; one click cannot halt the run
doing nothing	cheap today	the real competitor – and the one the regulator is closing

— **Where we differ in one line:** the order expires, the stop is a single call, and the receipt is the audit artifact.

Two builders, one weekend, 152 commits.

Illia Znachenok

THE JOURNEY & THE CHARACTER

- Built the operator journey: SAY · SEE · UNDERSTAND · DECIDE · WITNESS · PROVE · WIN.
- Carried one voice from the film into the live flow — a locked clip per beat.
- Fixed the control plane: the action's class is read from the evaluated decision, not a second source.

Dmytro Poznanskyi

THE CONTROL SURFACE & THE RECORD

- Built the console — the kill switch with real enabled and disabled states, reaching the node.
- Wrote the layout guards that fail on the bug, and a sweep that fails on any panel size.
- Wrote the architecture record in English, with a checker that keeps it honest.

- **Both technical, both in the git log.** No advisors, no logos, no borrowed credibility — the commits are dated 3–4 October 2026.
- **What one weekend bought:** 152 commits, a live node, 306 tests, a film, and this run you can walk yourself.

What we want is not a cheque. It is one real tool server.

- **From the jury:** walk the live node and try to break the rule — the URL is on the cover and the back. If you find a call that crosses the line, that is the most valuable thing you can hand us.
- **From a firm:** one business function, one tool server, two weeks. We place the node, you keep the receipts, and a person on your side holds the revoke.
- **What we do not ask for:** trust in a platform we have not built, or a promise we cannot show as a receipt.
- **Momentum, not a wish:** the kernel, the console, the voice and the film already exist — what is missing is the first real tool server we do not control.

The agent proposes. **TENET** decides. Data moves only after authorization.
